

Sunshine Canyon Expanding Remote Wellhead Infrastructure

August 17, 2018

SYLMAR, Calif. (Aug. 17, 2018) – In June, the Sunshine Canyon Landfill team reported that one of the landfill gas enhancements we have implemented at the facility is a remoted wellhead, a series of multiple wellheads affixed to a common location where vacuum is applied to pull landfill gas from the Landfill. This infrastructure is an effective solution to protect and preserve gas wells installed in the active disposal areas, as it promotes more efficient landfill gas collection and easier and safer disposal operations.

As we expand this infrastructure across the Landfill, our team has begun modifying an additional 20 landfill gas wells with remoted wellheads. Over the coming weeks, we will install more than two miles of gas well piping to support these continuing landfill gas collection and control enhancements. We anticipate completing this project by September 1.
